

MERIDIAN MANUFACTURING CO.

Company Profile & Facility Overview

Document No: MM-GEN-001 | Revision: A | Issued: July 2025

About the Company

Meridian Manufacturing Co. is a precision metal parts manufacturer specializing in CNC-machined components for industrial equipment, mechanical assemblies, and OEM (original equipment manufacturer) customers. The company operates a single production facility combining precision machining, automated material handling, and in-house quality inspection under one roof.

Industry & Products

Meridian's core business is contract precision machining: converting raw aluminum, steel, and composite stock into finished mechanical components to customer specification. Typical products include machined housings and enclosures, mounting brackets, structural mechanical parts, and precision-toleranced components supplied to industrial equipment manufacturers. The company does not sell a branded consumer product; its customers are other manufacturers who integrate Meridian's parts into larger machines and assemblies.

Production Workflow

Raw material stock enters the machining cell, where it is milled to spec on CNC equipment such as the CNC Mill X500. Finished parts are transported via the CB200 conveyor belt system from the milling cell to the inspection station, where dimensional and visual quality checks are performed before parts are packaged and shipped to the customer.

Raw Material	CNC Machining	Conveyor Transport	Inspection	Shipping
--------------	---------------	--------------------	------------	----------

Facility & Equipment

Attribute	Detail
Facility Type	Single-site precision machining plant
Key Equipment	CNC Mill X500 (3-axis machining center), CB200 conveyor system
Materials Processed	Aluminum, steel, select composites
Production Model	Contract / OEM precision machining
Quality Process	In-house dimensional and visual inspection post-machining
Maintenance Model	Scheduled preventive maintenance + operator daily checks (see equipment manuals)

Maintenance & Support Program

All production equipment follows a documented preventive maintenance schedule ranging from daily operator checks to annual qualified-technician servicing. Equipment-specific manuals (e.g. the CNC Mill X500 Equipment Manual and CB200 Troubleshooting Guide) contain detailed troubleshooting steps, error code references, and maintenance log history used by the floor maintenance team.

Note: This is a fictional company profile created as sample test data for evaluating a manufacturing maintenance RAG (retrieval-augmented generation) query system. All names, products, and details are illustrative only.
